

Email *setup.*

BY ADINA LIEBLICH • CIVIL ENGINEER • PERTH, AUSTRALIA

The portfolio site, cinematic v2 page, all 6 concepts, and the README concept all link <mailto:hello@adinaliebllich.com>. That address is **not currently receiving mail**. This doc walks through wiring it up via Cloudflare Email Routing — free, ~5 minutes, no card needed.

Why Cloudflare

- Free (no card, no trial)
- Forwards to your real inbox (Gmail) — you read + reply from there
- No DNS expertise needed — Cloudflare does the SPF/DKIM/MX records for you
- Recipient address can be anything: [hello@](#), [adina@](#), [me@](#) — all forward to the same Gmail
- LinkedIn / recruiters see a professional domain address, not your personal Gmail

Setup (5 min)

1. Move DNS to Cloudflare (if not already)

You can check at <https://dash.cloudflare.com/> — log in, look for [adinaliebllich.com](#) in your sites. If it's there, skip to step 2.

If it's not: 1. <https://dash.cloudflare.com/> → Add site → enter [adinaliebllich.com](#) 2. Pick the Free plan 3. Cloudflare will show you 2 nameservers (looks like [ns1.cloudflare.com](#) / [ns2.cloudflare.com](#)) 4. At your domain registrar (probably GoDaddy / Namecheap), change the nameservers to the Cloudflare ones 5. Wait 5-30 min for propagation 6. Cloudflare emails you "site is active" when done

Note: changing nameservers may briefly affect your existing DNS records (the ones pointing [app.adinaliebllich.com](#), [vote.](#), [demo.](#) at AWS). Cloudflare imports them automatically but verify after the switch that

those subdomains still resolve.

2. Enable Email Routing

1. In Cloudflare dashboard → click `adinalieblisch.com`
2. Left sidebar → **Email** → **Email Routing**
3. Click **Get Started / Enable**
4. Cloudflare will auto-add the necessary MX + TXT (SPF) records — accept them
5. Wait ~1 min for the records to propagate

3. Add the forwarding rule

1. In Email Routing → **Routes** tab
2. Click **Create address**
3. Custom address: `hello`
4. Action: **Send to an email**
5. Destination: your Gmail (e.g. `adinalieblisch@gmail.com`)
6. Save

4. Verify destination

- Gmail will get a "verify this destination" email from Cloudflare
- Click the link
- Done

5. Test it

Send a test email from your phone to `hello@adinalieblisch.com` . Should land in your Gmail inbox within ~30 seconds.

Optional — catch-all

In Email Routing → **Routes** → **Catch-all address** → set to forward to your Gmail. Then

`anything@adinalieblisch.com` works (`adina@` , `me@` , `engineer@` , etc). Useful for giving different

addresses for different contexts (e.g. `careers@` on LinkedIn).

What lives where (after setup)

ADDRESS	WHERE IT APPEARS	GOES TO
<code>hello@adinalieblich.com</code>	Portfolio contact section, all 6 concept pages, cinematic v2	Your Gmail
<code>mailto:</code> links	Every concept's contact CTA	Triggers your default mail app to compose

If you want to change the address

Just edit the 9 files where it appears:

```
grep -rn "hello@adinalieblich.com" pwa-v2/public/
```

Files (as of this writing): - `pwa-v2/public/concepts/brutalist.html` - `pwa-v2/public/concepts/editorial.html` - `pwa-v2/public/concepts/gallery.html` - `pwa-v2/public/concepts/terminal.html` - `pwa-v2/public/concepts/readme.html` - `pwa-v2/public/portfolio-preview.html`

Sed one-liner if you want to rename to `adina@adinalieblich.com` :

```
find pwa-v2/public -name "*.html" -exec sed -i 's/hello@adinalieblich.com/adina@adina
```

Then add the new prefix to Cloudflare Email Routing → Routes.

TL;DR

5 steps to working email at `hello@adinalieblisch.com` : 1. Site on Cloudflare ✓ 2. Enable Email Routing ✓ 3. Add `hello` → your Gmail rule ✓ 4. Verify Gmail destination ✓ 5. Test ✓

No code change needed on the portfolio. The address already works in HTML.
